

### Three-year winter package

Successive cold winters, an exceptional case

Three extremely cold winters in a row are another striking evidence that naval war generated ice age conditions in Northern Europe. A demonstration could already be made on the basis of the statistics of the three winter temperatures in De Bilt, Oslo and Stockholm. Evidence is based not only on the sudden and extreme cold wave, which hit the Northern Europe and the maritime locations, but also on the fact that such a situation had never been observed before.

Fortunately, the 'three-year package' theory doesn't rely only on temperatures in order to prove that war at sea was the cause of the cooling phenomenon, but can rely on a number of additional aspects. For example, snow covered the British Isles, sea ice covered the Baltic Sea and the regions, which had the most significant naval activities, had to deal with record cold temperatures during the next winter.

Mentioned issues offer us a rich investigation field and will be discussed and explained with the help of materials published during WWII or shortly after. That includes early observation and references to the extremely low temperature conditions.
